Ava Dennis

avadennis117@gmail.com • 541-678-2947 • linkedin.com/in/ava-dennis117

Software Engineer with 1+ year of full-time professional experience and two internships building production web applications in JavaScript, Vue, PHP, and WordPress.
Full-stack and cloud project experience with personal projects.
B.A. Computer Science, Summa Cum Laude.

Professional Experience

COMPANY: CORPORATE TOOLS
Junior Front End Engineer
Jan 2025 - Feb 2026

- Pushed code daily to GitLab using CI/CD pipelines, and tested and reviewed merge requests through all stages of development.
- Built and maintained WordPress sites on a LEMP stack (Linux, Nginx, MySQL, PHP), using Docker and Devilbox for local and staging environments throughout the full deployment pipeline.
- Technical skills: CI/CD, Git, bash, REST API, Javascript, PHP, Wordpress, Vue, Cursor, Vite, Webpack
- Volunteered to serve as technical lead for a product team.
- Led highest-priority project on our highest-traffic site, building a custom ACF block that collects end user input and submits a payload to an API endpoint
- Co-mentored frontend intern in the summer of 2025
- Unofficial Office Creative Director

COMPANY: 2BARRELS
Front End Web Developer Intern
Jun 2024 - Aug 2024

- Collaborated with a team of 20+ front end developers to maintain multiple sites within an Agile workflow using 2-week sprint cycles, daily standups, and Jira for ticket tracking
- Technical skills: in SCSS, CSS, Javascript, HTML, Wordpress, Vue 3, and PHP
- Demoed FE Sites Library to stakeholders for adoption as an internal dev resource

COMPANY: 14FOUR
Web developer Intern
Jun 2023 - Sep 2023

- Built and maintained client-facing websites using Javascript, HTML, CSS, SCSS, GSAP, Nuxt 2, Vue, Liquid, Shopify, and Squarespace
- Adopted team code standards and file structure conventions from experienced developers for improved code readability and collaboration

What I'm Proud of

1 of 2 students honored to give Commencement speech for my graduating class of 2025

Top 2% of students to graduate Summa cum laude

1 of 2 students awarded most Outstanding Computer Science student in graduating class of 2025

Top 4% of athletes to get recruited to play college basketball

Only student voted to be Senator of largest college dorm at Whitworth

Top 8% of students awarded the Scholastic art awards silver key for artwork

Education

Whitworth University
B.A. Computer Science
(Human Computer Interactions)
GPA: 3.96
Graduated: 5/20/25
Code languages used in college
Python Java C++
Assembly SQL React

Certification

Learn C++ Programming, Abdul Bari

Located in

Spokane, WA. Open to remote

Portfolio Projects: https://avadennisportfolio.netlify.app/

Full Stack Engineer Project: Digital Deck
github link: https://github.com/aD3nnis/DigitalDeck
A real-time multiplayer card game built with TypeScript, React, and Next.js on the frontend and Java with Spring Boot on the backend. The server controls the deck, shuffle, and turn rules, so no player can see the shuffle or another player's hand. Players join by session code. Live game state is stored in Redis, and updates go to every player over WebSockets (STOMP). Includes reconnection handling, unit-tested turn rules, and a Docker Compose setup.

Frontend Engineer Project: Vue: FE Sites Library
github link: https://github.com/aD3nnis/Frontend-Dev-Resource-Library
A Vue 3 + Vite SPA that displays a searchable, filterable directory of frontend dev resources. Implements search, multi-criteria filters, list/card views, sorting, and pagination using a custom reactive store, Axios, Vue Router, and SASS.

Cloud Engineer Project: AWS: Uptime Monitor
github link: https://github.com/aD3nnis/aws-uptime-monitor
Serverless AWS uptime monitor using a Lambda function triggered every 5 minutes to check websites, log response-time metrics to CloudWatch, and send SNS email alerts when a site is down or slow.

Software Engineer Project: C++: OOD House Generator
github link: https://github.com/aD3nnis/house-generator
Built a procedural floor plan generator in C++ that converts user-defined room counts and square footage into a randomized ASCII grid layout, applying core OOP principles — abstraction, encapsulation, inheritance, and polymorphism — to organize logic across room sizing and placement.

Full Stack Engineer Project: Bitcoin Price Tracker
github link: https://github.com/aD3nnis/stonks
Built and deployed a full-stack Bitcoin price tracking application using a Node.js/Express backend hosted on Render, PostgreSQL database on Neon, REST API integration with LiveCoinWatch, and a React frontend deployed via Netlify.

Software Engineer Project: Python: AI Snake Game
github link: https://github.com/aD3nnis/AI-Class-Project
Python turtle-based Snake game pitting the player against AI-controlled enemies using multiple decision-making strategies, including random movement, max search, and alpha-beta pruning to demonstrate and compare AI behaviors.
